CAKE CAPER

A Woodland Council Operation

There is cake. We have a plan.

2-4 raccoons. Two moves each. One very questionable getaway.

Actual prototype interface - opening screen

Plan together. Commit. Watch the consequences. Rescue the mess.

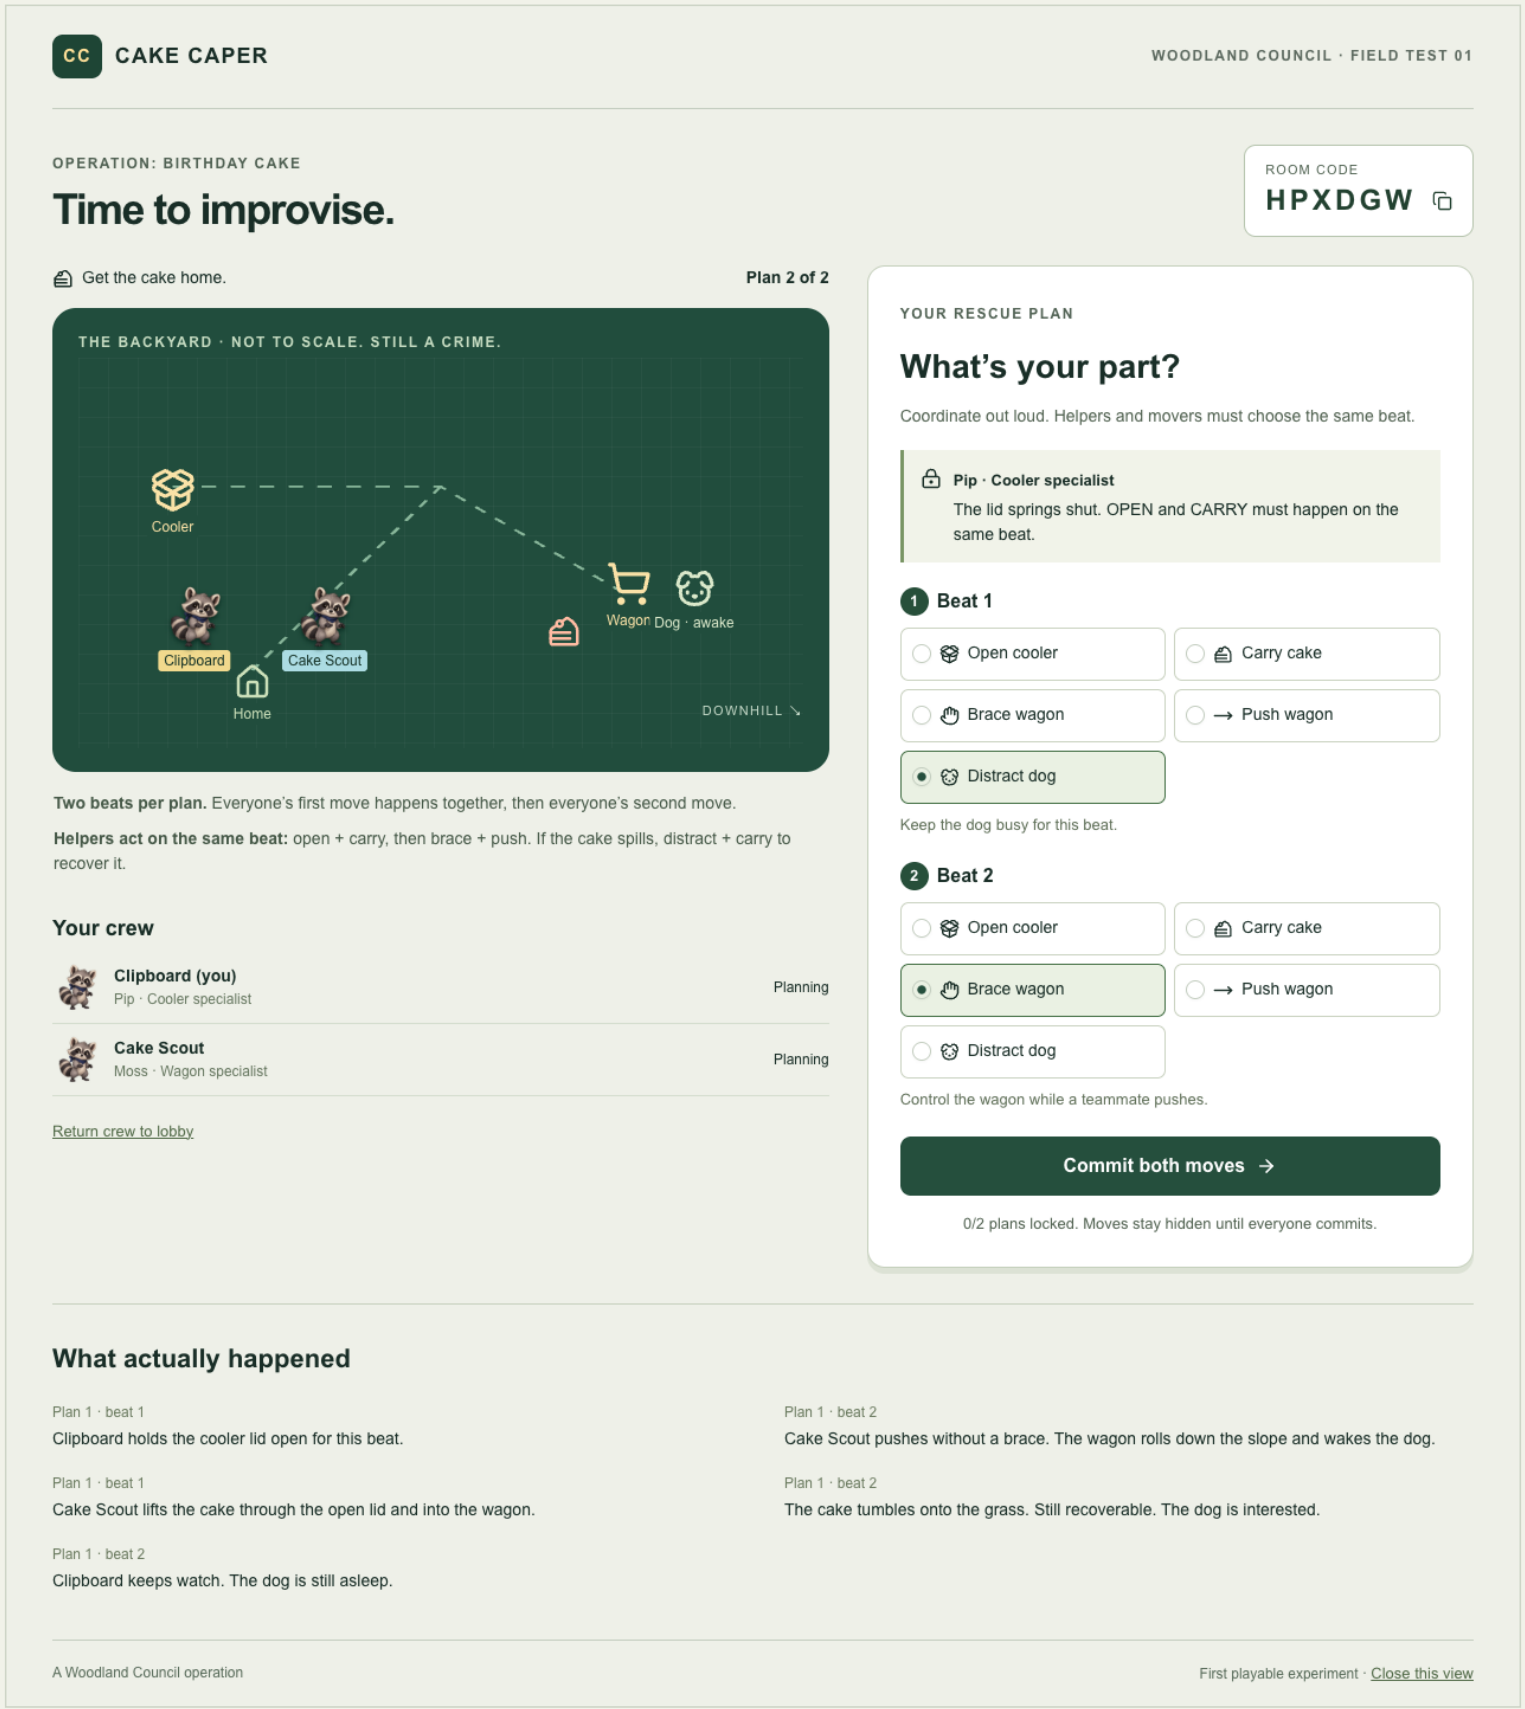

A coordinated first plan can succeed. If the cake spills, one recovery plan gives the crew a chance to bring it home.

Time to improvise.

Everyone chooses two actions. The first moves resolve together, then the second. Here, an unbraced push has spilled the cake and woken the dog.

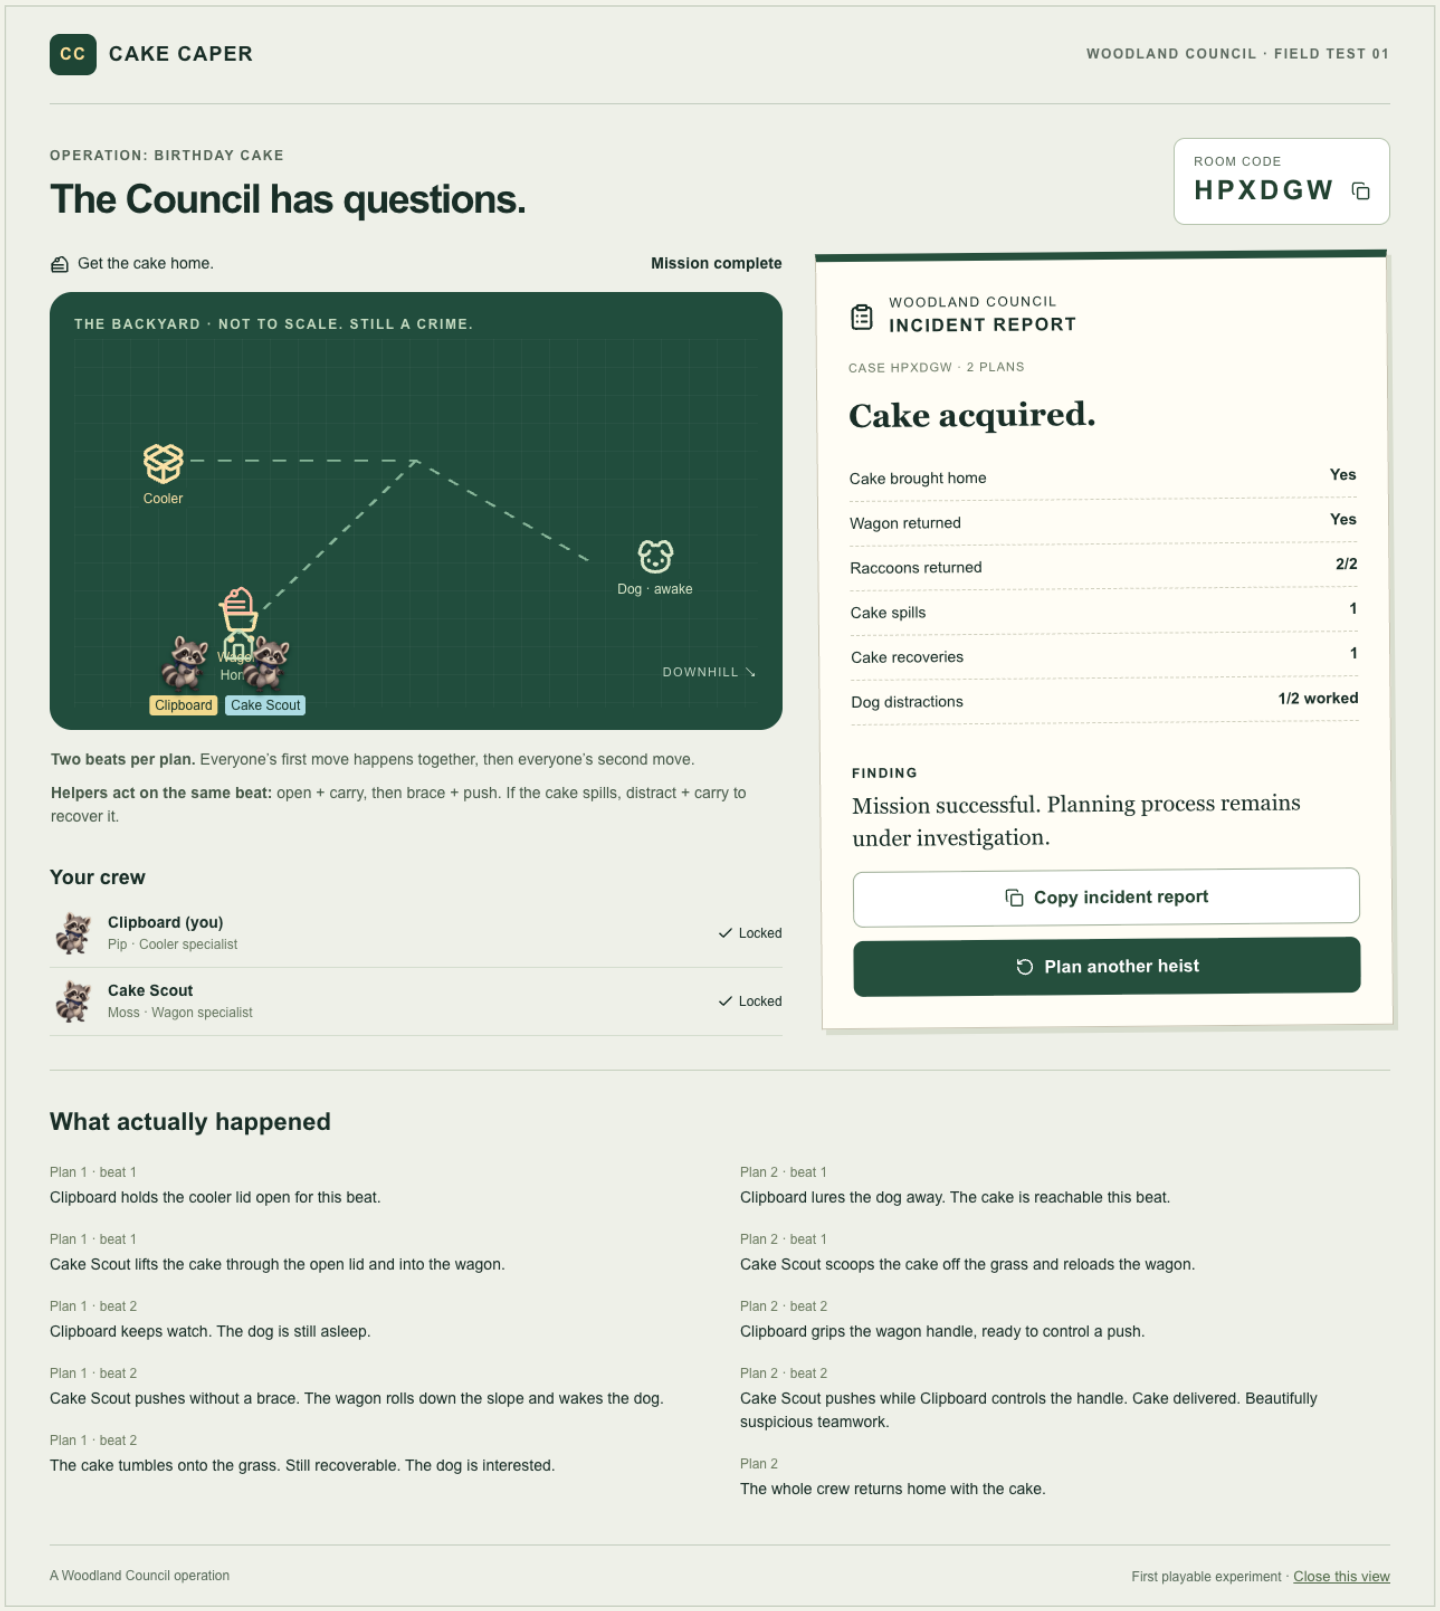

Actual prototype interface - one recovery plan remains

Open + carry. Then **brace + push.**
Cake on the grass? **Distract + carry** gets the rescue started.

A story the crew made.

The incident report uses the actual event log. This crew spilled the cake once, recovered it once, and brought everyone home.

Actual prototype interface - successful rescue and incident report

What exists: shared rooms, private plans, a synchronized reveal, recovery, original raccoon art, and factual reports. No model API calls during play.
What comes next: real group playtesting, more replayability, and polish. One fixed mission today; this is a private prototype, not a submitted contest entry.
